1-2. Tendon lengths and count and concrete quantity estimate on plan are for estimating

purposes only. Contractor should verify all tendon lengths and concrete quantity prior to

installation. Concrete quantity must be adjusted for sloping site and forming irregularities.

Concrete quantities are not exact. Draped tendons are not shown, U.N.O., for plan clarity.

1-3. Plan shows the location of structural reinforcement, beam depth and beam locations only.

forms. Report any discrepancies to the Engineer. The forms should be built using the

Residential Slabs-on-Ground: BRAB No. 33, WRI/CRSI-81 Design of Slab-on-Ground

1-6. Vertical control joints should be used in exterior masonry to the full height spaced

2-2. All underslab "Forming Fill" shall have a P.I. less than 20 and be free of organics.

architectural plans--not the Engineer's plan. Do not scale plan.

1-4. This design is in accordance with the Criteria for Selection and Design of

1-5. These plans are copyright MLAW as of the year dated.

concerning "approved" and "unapproved" fill.

Architectural dimensions must be compared to the architectural plans prior to construction of

Foundations or PTI Design of Post-Tensioned Slabs-on-Ground 3rd Edition, The 2003 and

approximately 25 feet apart. A joint should be located directly above all slab control joints.

2-1. All site work shall be performed in accordance with FHA Data Sheet 79-G. Refer to notes

3-1. Concrete shall have a minimum compressive strength of 3000 psi at 28 days. Concrete

should be minimum 2000 psi at full tendon stressing. All concrete work shall meet A.C.I 318.

Concrete shall be deposited in forms no later than two hours after water is mixed at the plant.

2009 International Residential Code, and Standard Building Code and recognized Engineering

NOTES

- 5-0. REINFORCING
 5-1. All reinforcing bars shall be ASTM A-615 Grade 60, except Grade 40 may be used for stirrups, corner bars and hairpins
- 5-2. All tendons shall be 270k grade, 7 wire strand, 1/2 inch diameter, U.N.O., greased and sheathed with a continuous extruded plastic sheathing. 5-3. Anchorage system shall be a monostrand unbonded tendon anchorage utilizing a cast
- wedge plate and a two piece wedge as manufactured by a P.T.I. approved manufacturer. 5-4. All post-tensioned tendons and anchors shall conform to the requirements of the latest
- "P.T.I. Guide Specifications For Post-Tensioning Materials." Post-tensioned tendon supplier to be P.T.I. factory certified.
- 5-5. PARTIAL STRESS all tendons to 13.3 kips (or half of final jacking force) 24 to 48 hours after concrete placement.
- 5-6. FULL STRESSING of all tendons to 33 kips 7 to 10 days after concrete placement.
- The first tendon in the slab shall be a maximum of 14 inches and a minimum of 6 inches from the outside form. Tendons not dimensioned on plan to be equally spaced.
- 5-8. (1) #3 x 24 inches x 24 inches corner bar required at all exterior corner's top for beams reinforced with cables OR 24"x24" corner bars equal to steel beam size and spacing if beam is steel reinforced. Deepened beams to have corner bars with diameter equal to horizontal steel at each horizontal bar.
- 5-9. At plumbing stacks, add #3 bars x size of opening plus 16 inches to be placed in concrete 2 inches beyond perimeter of opening (not req'd. if cables are partial stressed - see note 5-5).

6-0. PLAN VARIATIONS

- 6-1. All depth dimensions of beams are minimum unless intact rock is encountered at less depth. Inspector may approve beams continuously on rock to minimum beam depth of 12 inches. Deepen EXTERIOR beams where required by site conditions at least 6 inches into virgin soil, U.N.O. or unless deep beam detail applies.
- 6-2. When PI is 38 and greater and trees are within 15 feet of foundation, consult MLAW "Policies Concerning Trees" latest revision.
- 6-3. Should conditions arise that are not covered by details on this plan, contact Engineer at once for additional instructions.
- 6-4. In areas to receive tile, we recommend installing 6x6x1.4x1.4 WWF 1-1/2" below concrete surface and bedding the tile on a bond breaker to prevent shrinkage cracks from reflecting through the tile.
- 6-5. HARD POINTS If the depth of underslab clean fill at any beam intersection (total depth, not from beam bottom), exceeds 60 inches SANDY LOAM or 84 inches ROAD BASE, place hard points through the fill. Use of 12 inch diameter pre-formed or drilled, concrete piers. And all beams to have tendons or steel. (If hardpoint depth exceeds 6'-0" from top of slab reinforce w/ (4)-#4 vert. & #3 ties @ 24" O.C.) If total underslab fill exceeds 12 feet, contact Engineer.

TREE POLICY- APPLIES TO P.I.'S = 38 AND GREATER TREE WITHIN 5 FEET FROM FOUNDATION:

- a. Add 20'-0" of section 3 steel center on tree in exterior beam only, OR b. Deepen beam 24" into existing soil for 20'-0" - exterior beam only
- TREE 5 TO 15 FEET FROM FOUNDATION: a. Add 20'-0" of section 3 steel - center on tree in exterior beam only, OR b. Deepen beam 12" into exsting soil for 20'-0" - exterior beam only.
- Add 6" wide trench 24" into existing grade 20'-0" long centered on tree and filled with un-reinforced concrete

OPTIONAL PROVISIONS TO BE ENFORCED, IF CHECKED:

FILL (UNAPPROVED). The fill material on this site is unsuitable to support a slab-on-ground foundation. The fill must be penetrated by all grade beams and extend a minimum of 6 inches into virgin soil. As an alternative, see HARD POINTS note. Based on the soils investigation, unapproved fill appears to be approximately

FILL (APPROVED). The fill material is acceptable to support a slab-on-ground foundation. Construct exterior grade beams 6 inches into approved fill. "Approved Fill" is fill that has been approved by MLAW, based on proper exploration, testing, or inspection by an agency acceptable to MLAW.

One addition of water will be permitted at the job site to adjust the slump to a maximum of 6 3-2. Concrete shall be well consolidated using proper mechanical vibration, especially in the vicinity of the tendon anchorage.

2-0. SITE PREPARATION

practices.

3-3. If conduit in slab is required prior to concrete placement, location to be verified in field. Piping, vents or electrical cables shall be placed so as not to reduce slab thickness. Plumbing and/or conduits larger than 1" diameter must be trenched into underslab fill.

3-4. If unanticipated interruptions in concrete placement occur, and concrete harder temporary forms must be used for setting of construction joints or concrete must be chipped to form vertical joints prior to setting additional slab. Use #3 X 24" dowels at 12" O.C. epoxied #2 A into existing concrete to bond old to new concrete

3-5. FLATWÖRK MAY BE PLACED ONLY AFTER STRESSING.
